

Residue evaluation of certain veterinary drugs: 70th Meeting 2008 (FAO JECFA Monographs)

At this session, three substances were evaluated for the first time for the animal species concerned, avilamycin, monensin and narasin. Four substances were reassessed, dexamethasone, tilmicosin, triclabendazole and tylosin. The residue monographs provide information on chemical identity and properties of the compounds, pharmacokinetics and metabolism, residue depletion studies and analytical methods validated and used for the detection and quantification of the compounds. This publication and other documents produced by JECFA contain information that is useful to those who work with or are involved with recommending or controlling maximum residue limits for veterinary drugs in foods.
